

The Canadian Mineralogist
Vol. 42, pp. 905-913 (2004)

**NEW MINERALS AND NOMENCLATURE MODIFICATIONS APPROVED
IN 2003 BY THE COMMISSION ON NEW MINERALS AND MINERAL NAMES,
INTERNATIONAL MINERALOGICAL ASSOCIATION**

ERNST A.J. BURKE[§]

*Faculteit der Aard en Levenswetenschappen, Vrije Universiteit Amsterdam, De Boelelaan 1085,
1081 HV Amsterdam, The Netherlands*

GIOVANNI FERRARIS[¶]

Dipartimento di Scienze Mineralogiche e Petrologiche, Università di Torino, Via Valperga Caluso 35, I-10125 Torino, Italy

The information given here is provided by the Commission on New Minerals and Mineral Names (CNMMN), International Mineralogical Association (IMA), for comparative purposes and as a service to mineralogists working on new species. Each mineral is described in the following format:

IMA Number
Chemical Formula (any relationship to other minerals; structure analysis)

Crystal system, space group
unit-cell parameters
Color; luster; diaphaneity
Optical properties
Strongest lines in the X-ray powder-diffraction pattern [*d* in Å(*l*)]

The names of these approved species are considered confidential information until the authors have published their descriptions or released information themselves. No other information will be released by the Commission.

2003 PROPOSALS

IMA No. **2003-001**

(Ba,Ca,K,Na,Sr)₅Al₉Si₂₇O₇₂•22H₂O

The Ba-dominant analogue of heulandite Structure determined

Monoclinic: *C2/m*

a 17.738, *b* 17.856, *c* 7.419 Å, β 116.55°

Colorless to white, rarely very pale yellowish white; vitreous, pearly; translucent to transparent

Biaxial (+), α 1.5056, β 1.5064, γ 1.5150; 2*V* (meas.)

38, 2*V* (calc.) 34.1°

7.94(66), 5.12 (59), 4.65(66), 3.978(97), 3.181(56), 2.973(100), 2.807(65)

IMA No. **2003-002**

Na(Ba,Sr,Na,REE)PO₄

The Ba-dominant analogue of olgite Structure determined

Trigonal: *P3*

a 5.549, *c* 7.032(2) Å

Light green; vitreous; transparent

Uniaxial (-), ω 1.628, ε 1.623

7.04(22), 3.964(60), 2.839(100), 2.774(100), 2.344(20),

1.984(40), 1.611(26)

Exceptionally, the name of this new mineral is published here, on request of the author (Roberta Oberti of Pavia, Italy). Similar amphibole material has been previously described as "tirodite", but this name was discredited in the 1997 paper on amphibole nomenclature, the revised name being "(alkali-bearing) manganocummingtonite". The new name "parvowinchite" has already been attributed in the Leake *et al.* (2003) amphibole paper (*Canadian Mineralogist* **41**, 1355-1362) to the specimen described by Oberti & Ghose (1993, *European Journal of Mineralogy* **5**, 1153-1160). Because further characterization of the available material is not possible, no further report will be published.

OTHER DECISIONS CONCERNING NOMENCLATURE

IMA No. **03-A**

It has been approved that the general CNMMN advocacy of Schaller modifiers [Hey & Gottardi (1980): *Can. Mineral.* **18**, 261-262; Nickel & Mandarino (1987): *Can. Mineral.* **25**, 353-377] is to be dropped. When it is desired to indicate the presence of subordinate chemical components in a mineral, Schaller modifiers may be used in unambiguous cases, namely those in which the element has two, and only two, valence states. In the more general case, adjectival modifiers such as "-bearing" or "-rich" should be used, together with the specified element(s), and with the numerical oxidation state, if required, *e.g.*, "Mn²⁺-rich", "V(III)-deficient", "Mg-bearing", *etc.*

IMA No. **03-B**

Spodiosite is discredited. Spodiosite is a mixture of fluorapatite, calcite and serpentine.

IMA No. **03-C**

Naming polytypes of wagnerite: The known polytypes of wagnerite, ideally $\text{Mg}_2(\text{PO}_4)\text{F}$, are named wagnerite-*Ma2bc* (space group $P2_1/c$), wagnerite-*Ma5bc* (space group Ia), wagnerite-*Ma7bc* (space group $P2_1$) and wagnerite-*Ma9bc* (space group Ia). Polytypes of zwieselite and triplite can be written in analogy with those of wagnerite.

Magniotriplite is discredited. Magniotriplite and wagnerite are polytypes, not polymorphs, of one another. The name wagnerite has priority (1821 *versus* 1951 for magniotriplite). Therefore, the species and name *magniotriplite* are discredited.

NOMENCLATURE OF A MINERAL GROUP

Amphiboles: additions and revisions to the International Mineralogical Association's amphibole nomenclature. See *Can. Mineral.* **41**, 1355-1362 (2003), *Eur. J. Mineral.* **16**, 191-196 (2004), and other journals, and also on the CNMMN website (www.geo.vu.nl/~imacnmmn).

IMA No. 2003-058

Mazzite is renamed mazzite-Mg: the approval of IMA No. 2003-058 as a new mineral automatically implies that the name of the existing mazzite is changed to mazzite-Mg, and that these two minerals form the new mazzite series within the zeolites.

WITHDRAWAL OF AN APPROVED MINERAL

Prassoite: the mineral prassoite, Rh_3S_4 , was approved as mineral 70-041 by the CNMMN in March 1971. The author, Kingston, published some data in his Ph.D. thesis in 1977. These data were summarized by Cabri in 1981, but he stated that the true formula might be $Rh_{17}S_{15}$. Augé found the same mineral as Kingston in 1988, with the formula Rh_3S_4 (*Can. Mineral.* **26**, 177-192), and this paper was mentioned by Jambor in 1989 (*Am. Mineral.* **74**, 1220).

Britvin *et al.* proposed the mineral miassite (97-029) to the CNMMN with the formula $Rh_{17}S_{15}$. This mineral was approved in October 1997, but the name was suspended because of possible problems with prassoite. The authors were asked to contact Kingston. They tried to do so, but to no avail.

After having heard from Britvin *et al.* that Kingston did not reply to any search, the suspension on the name miassite was lifted, but the CNMMN chairman then made a mistake (probably by not having access to the 1971 archives). In his Memorandum of July 1999, Joel Grice wrote: "Prassoite" was never approved by the CNMMN, and no type material can be found. It is apparent that the authors of miassite have done everything possible to establish or refute the existence of this dubious mineral, and the name "prassoite" is to be discouraged from further usage. In his letter to Britvin *et al.*, lifting the suspension, Joel Grice wrote: "I would ask you to make it clear in your publication that all attempts were made to find the type material for a formal discreditation of prassoite, but none existed."

Britvin *et al.* published their article on miassite in *Zap. Vser. Mineral. Obshchest.* **130**(2), 41-44 (2001), stating in the paper that prassoite was never approved by the CNMMN, this of course on the authority of Joel Grice. The paper was abstracted by Jambor (*Am. Mineral.* **87**, 1511), with the correction that prassoite had indeed been approved by the CNMMN back in 1971.

Later, it became apparent that the type material of prassoite was present in the British Museum (on the same specimen as the type material for kingstonite), but the letters of Britvin *et al.* to Kingston were never forwarded to the curator of the British Museum.

We have meanwhile the strange fact that there are at least ten papers using the name prassoite [the most recent one in *Can. Mineral.* **40**, 1127-1146 (2002)], but only a single paper on miassite! Moreover, the name "prassoite" has never been officially discredited or withdrawn.

In view of the delay in the (incomplete) publication of the inadequately described prassoite and the uncertainties about its composition, the name "prassoite" is withdrawn for the time being in favor of miassite. Unambiguous evidence for the existence of Rh_3S_4 as a mineral might reinstate the name "prassoite".

RECOMMENDATIONS ON CNMMN PROCEDURES

On request of and according to the proposal of Donald Peacor, the following recommendations on CNMMN procedures have been approved in 1999-2000, but never published until now:

- Mineral status should be accorded to those materials occurring in submicrometric crystallites only if they are of sufficient total volume or concentration to be detected by at least one commonly used laboratory technique.
- CNMMN criteria for approval of mineral species status should be viewed as flexible guidelines.
